Title:

Description: Perfect Score: 109 >US-08-991-628-6 (1-15) from US08991628.pep

Sequence: 1 SARTLNNRYTGPYTF 15

Scoring table: PAM 150 Gap 15

77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 27.195; Variance 33.825; scale 0.804

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 26.176; Variance 36.644; scale 0.714

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14-JUN-1993 (first entry)
Human pemphigus vulgaris 130kb antigen.
Pemphigus vulgaris; skin disease; autoantibodies;
keratinocyte cell surface antigen; glycoprotein; cell adhesion.
                                                                                                                                                                                                                                                                                                                                                  Recombinant vaccinia virus - is which all or part of DNA coding membrane fusion protein in combined to genom region. Disclosure; p; Japanese. Fragment of parainfluenza viral membrane fusion protein encoding may be incorporated into the vaccina virus, which may then be use as a live vaccine for cows.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 93-067436/08.

Nod genes and control sequences of Bradyrhizobium japonicum - used for improving nodulation and for prodn. of foreign protein, e.g. plant parasite toxin
pisclosure; Page 4; llpp; English.
The nod I gene product may be used to restore nodulating ability to Nod- mutants of Bradyrhizobium or Rhizobium strains and can enhance nodulating ability.

Claim 6; Page 29; 49pp; English.

Transgenic plants expressing this cold acclimatization

Protein have improved cold tolerance and/or drought-resistance.

The cell expressing the protein is from the family Solanaceae,

a citrus plant, a bacterium or a yeast cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PT DNA encoding MHC class II trans-activator polypeptide(s) - useful procession of expression of genes encoding MHC in dendritic cells inhibitors of expression of genes encoding MHC in dendritic cells Disclosure; Pages 66-69; 86pp; French.

The present sequence represents type IV CIITA (class II transactivator) protein. The products can be used to treat diseases for which centanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially conterferon-gamma or interleukin-4. Inhibitors of the gene or protein coding for MHC class II molecules is desired for dendritic cells or after induction by a cytokine, especially conterferon-gamma or interleukin-4. Inhibitors of the gene or protein coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc deleted and can be used for reducing the expression of major chistocompatibility complex (MHC) class II antigens. A ribozyme target in ct to bases 1159-1161 (GUA) of human CIITA mRNA, or corresponding target in cother species and the CIITA polypeptide can be used to reduce expression cc of MHC class II antigens, particularly for treatment of autoimmune cc disease (e.g. arthritis and diabetes) or to treat non human animals intended as source of xenografts. The ribozyme and the CIITA polypeptide cc may be generated in vivo by gene therapy, using the encoding nucleic cards targeted for localised suppression of the immune response. Material cfrom transgenic animals in which at least some cells are stably ctransfected with the CIITA encoding nucleic acids are used for animal-to-class II antigens, in cells that express them constitutively or after CC class II antigens, in cells that express them constitutively or after competitively inhibits endogenous CIITA.

Transforming a bacteria with the PPC encoding sequence intensifies CO2 fixation ability. Other PPC genes may also be found by hybridisation with an A.nidulans derived probe.

This represents a class II trans activator (CITTA) polypeptide. When the N-terminal region of the CITTA is deleted, it can be used for reducing the expression of major histocompatibility complex (MHC) class II antigens. A ribozyme targeted to-bases 1159-1161 (GUA) of human CITTA mRNA, or corresponding target in other species and the CITTA polypeptide can be used to reduce expression of MHC class II antigens, particularly for treatment of autoimmune disease (e.g. arthritis and diabetes) or to treat non-human animals intended as source of xenografts. The ribozyme and the CITTA polypeptide may be generated in vivo by gene therapy, using the encoding nucleic acids targeted for localised suppression of the immune response. Material from transgenic animals in which at least some cells are stably transfected with the CITTA encoding nucleic acids are used for animal-to-human transplantation. The CITTA polypeptide constitutively or after lymphokine induction. It has no transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon gamma or interleukin 4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Class II trans activator (CIITA) polypeptide.

Class II trans activator; MHC; CIITA; autoimmune disease; treatment; transplantation; xenograft; major histocompatibility complex; diabetes; gene therapy; arthritis; ribozyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W57056 standard; Protein; 1130 AA.

CC The present sequence represents type III CITA (class II transactivator) protein. The products can be used to treat diseases for which cenhanced expression of genes coding for MHC class II molecules is C desired, especially where the enhanced expression is desired in CC dendritic cells or after induction by a cytokine, especially for can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

For Gene encoding a protein displaying class II trans-activator of gene encoding a protein compsn. for treating diseases associated with impaired expression of MHC-II genes, etc.

Pr with impaired expression of MHC class II genes expression in Bymphocytes. The DNA class II gene expression in Bymphocytes. The DNA cc sequence has two in frame start codons. The first of these is at position In 6 and acts as the translation initiation site. The second is present cc (at position 188) in the context of a perfect Kozak box and may also contains three stretches rich in proline/serine/threonine. It also contains three stretches rich in proline/serine/threonine. It also contains a region rich in glutamate/aspartate (an acidic region) and an CC archains a region rich in glutamate/aspartate (an acidic region) and an CC archains a region rich in glutamate/aspartate (an acidic region) and an CC archains a region rich in glutamate/aspartate (an acidic region) and an CC acids 979 to 1061 that shows weak homology with the N terminal portion of a yeast RNA binding protein. The protein can be used for the CC aguence can be used to treat diseases where a decrease in the level of cartheirs and multiple sclerosis, lupus erythematosis and rheumatoid cartheirs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

Methods which inhibit transcription activation by CIITA - causes inhibition of MHC class II gene expression, used in therapy of auto:immune disorders

Example 1; Page 36-41; 64pp; English.
A genomic DNA sequence (T18028) codes for the class II transactivator, CIITA (R81599), a protein essential for activation of transcription of MHC class II genes. The CIITA transcription activation formation domain provides useful information for identifying cpds which inhibit CIITA-dependent transcription. Such cpds. are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      potential autoimmune disease therapeutics by virtue of their ability to inhibit transcription of the MHC class II genes. A second portion of CIITA, the interaction domain, mediates interaction of CIITA and its target protein and activates MHC class II promoters. Cpds. that inhibit this binding are also potential autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a type I CIITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.

Starch liquefaction - using mutant Bacillus alpha-amylase Disclosure; F19 4a; 56pp; English.
This sequence represents the M197T variant of the Bacillus licheniformis alpha-amylase. Variants of the protein can be used in the method of the invention, for liquefying a granular starch slurry from a wet or dry milling process at a ph of 4 to less than 6, that comprises adding a mutant Bacillus alpha-amylase to the slurry, optionally adding an antioxidant, and reacting the slurry until the starch is liquefied. The alpha-amylase has a substitution of Thy, Leu, Asn or Asp for a Net residue corresponding to M15 in B. licheniformis alpha-amylase. Alternatively the alpha-amylase has a substitution of Leu or Ala for a residue corresponding to M197 in B. licheniformis alpha amylase. Mutants such as M197L and M15L have enhanced oxidative stability at pH 5.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-:- THE COAT PROTEIN VP1 CONTAINS THE MAIN ANTIGENIC DETERMINANTS THE VIRION; THEREFORE, CHANGES IN ITS SEQUENCE MUST BE RESPONSIBLE FOR THE HIGH ANTIGENIC VARIABILITY OF THE VIRUS.
-:- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS, EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP3, AND VP4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FOOT-AND-MOUTH DISEASE VIRUS (APHTHOVIRUS C).
